Functions

INTRODUCTION TO PYTHON

Hugo Bowne-AndersonData Scientist at DataCamp

Functions

- Nothing new!
- type()
- Piece of reusable code
- Solves particular task
- Call function instead of writing code yourself

```
fam = [1.73, 1.68, 1.71, 1.89]
fam
```

```
[1.73, 1.68, 1.71, 1.89]
```

```
max(fam)
```

1.89

max()

```
fam = [1.73, 1.68, 1.71, 1.89]
fam
```

[1.73, 1.68, 1.71, 1.89]

max(fam)

1.89

```
fam = [1.73, 1.68, 1.71, 1.89]
fam
[1.73, 1.68, 1.71, 1.89]
max(fam)
1.89
 [1.73, 1.68, 1.71, 1.89]
                                          max()
                                                              → 1.89
```

```
fam = [1.73, 1.68, 1.71, 1.89]
fam
[1.73, 1.68, 1.71, 1.89]
max(fam)
1.89
tallest = max(fam)
tallest
1.89
```

```
round(1.68, 1)
1.7
round(1.68)
2
help(round) # Open up documentation
  round(...)
      round(number[, ndigits]) -> number
      Round a number to a given precision in decimal digits (default 0 digits).
      This returns an int when called with one argument,
      otherwise the same type as the number.
      ndigits may be negative.
```

```
round(...)
  round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

help(round)

```
round(...)
  round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

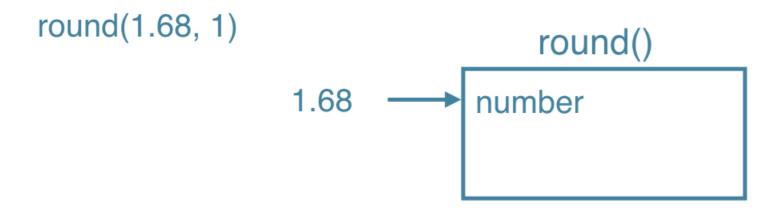

round(1.68, 1)

round()

```
help(round)
```

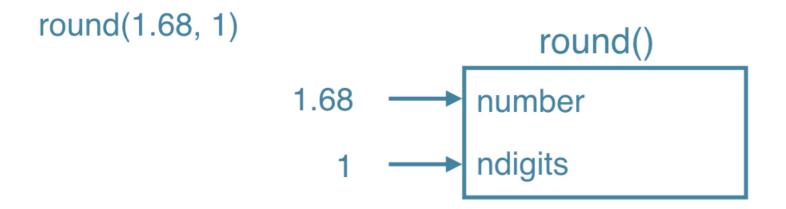

```
round(...)
  round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

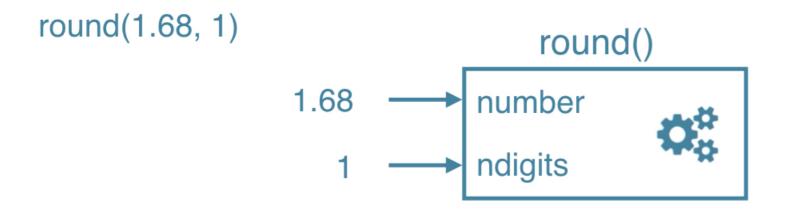

```
round(...)
  round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

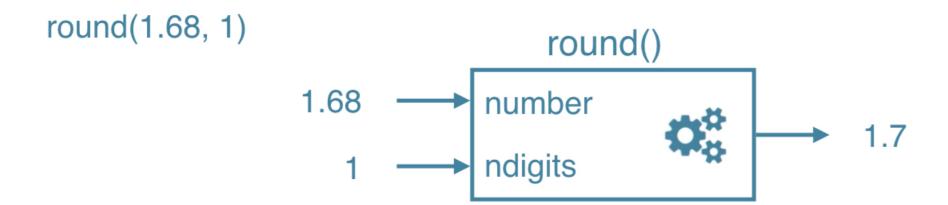

```
round(...)
  round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

```
round(...)
  round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

```
round(...)
  round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

round()			

help(round)

This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

- round(number)
- round(number, ndigits)

Find functions

- How to know?
- Standard task -> probably function exists!
- The internet is your friend

Methods

INTRODUCTION TO PYTHON

Hugo Bowne-AndersonData Scientist at DataCamp

Built-in Functions

- Maximum of list: max()
- Length of list or string: len()
- Get index in list: ?
- Reversing a list: ?

Back 2 Basics

sister = "liz"

Object

height = 1.73

Object

Object

Back 2 Basics

 Methods: Functions that belong to objects

Back 2 Basics

```
sister = "liz"
```

```
height = 1.73
```

```
fam = ["liz", 1.73, "emma", 1.68,
"mom", 1.71, "dad", 1.89]
```

 Methods: Functions that belong to objects

	type	examples of methods
Object	str	capitalize() replace()
Object	float	bit_length() conjugate()
Object	list	index() count()

list methods

```
fam
['liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89]
fam.index("mom") # "Call method index() on fam"
fam.count(1.73)
```

str methods

```
sister
'liz'
sister.capitalize()
'Liz'
sister.replace("z", "sa")
'lisa'
```

Methods

- Everything = object
- Object have methods associated, depending on type

```
sister.replace("z", "sa")

'lisa'

fam.replace("mom", "mommy")

AttributeError: 'list' object has no attribute 'replace'
```

Methods

```
sister.index("z")

2

fam.index("mom")
```

Methods (2)

```
fam
['liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89]
fam.append("me")
fam
['liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89, 'me']
fam.append(1.79)
fam
['liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89, 'me', 1.79]
```

Summary

Functions

```
type(fam)
```

list

Methods: call functions on objects

```
fam.index("dad")
```

6

Packages INTRODUCTION TO PYTHON

Hugo Bowne-AndersonData Scientist at DataCamp

Motivation

- Functions and methods are powerful
- All code in Python distribution?
 - Huge code base: messy
 - Lots of code you won't use
 - Maintenance problem

Packages

- Directory of Python Scripts
- Each script = module
- Specify functions, methods, types
- Thousands of packages available
 - Numpy
 - Matplotlib
 - Scikit-learn

```
pkg/
mod1.py
mod2.py
```

Install package

- http://pip.readthedocs.org/en/stable/installing/
- Download get-pip.py
- Terminal:
 - o python3 get-pip.py
 - o pip3 install numpy

Import package

```
import numpy
array([1, 2, 3])

NameError: name 'array' is not define

numpy.array([1, 2, 3])

from numpy import array
array([1, 2, 3])

array([1, 2, 3])

array([1, 2, 3])
```

from numpy import array

my_script.py

```
from numpy import array
fam = ["liz", 1.73, "emma", 1.68,
    "mom", 1.71, "dad", 1.89]
. . .
fam_ext = fam + ["me", 1.79]
print(str(len(fam_ext)) + " elements in fam_ext")
np_fam = array(fam_ext)
```

• Using Numpy, but not very clear

import numpy

```
import numpy as np
fam = ["liz", 1.73, "emma", 1.68,
    "mom", 1.71, "dad", 1.89]
. . .
fam_ext = fam + ["me", 1.79]
print(str(len(fam_ext)) + " elements in fam_ext")
. . .
np_fam = np.array(fam_ext) # Clearly using Numpy
```
